

## **Practical-4**

**1. Implement a stack using an array having following functionalities:**

- a. isEmpty – to check if the stack if empty or not**
- b. isFull – to check if the stack if full or not**
- c. push – to insert the element into the stack**
- d. pop – to delete an element from the stack**
- e. print\_top – to print the top most element of the stack.**

Aim:

To implement the concept of stack.

Theory:

In this practical we implemented the concept of pointers to structure and using it we implemented stack.

Code:

```
#include<stdio.h>
```

```
#include<stdlib.h>
```

```
struct Stack
```

```
{
```

```
    int top,size;
```

```
    int *array;
```

```
};
```

```
struct Stack* createStack(int size)
```

```
{
```

```
    struct Stack *s=(struct Stack *) malloc(sizeof(struct Stack));
```

```
    s->size=size;
```

```
    s->top=-1;
```

```
    s->array=(int *)malloc(sizeof(int)*size);
```

```
    return s;
```

```
}
```

```
int isEmpty(struct Stack *s)
```

```
{
```

```
    if(s->top== -1)
```

```
    {
```

```
        printf("The stack is Empty\n");
```

```
        return 1;
```

```
    }
```

```
    else
```

```
    {
```

```
        printf("The stack is not empty\n");
```

```
        return 0;
```

```
    }
```

```
}
```

```
int isFull(struct Stack *s)
```

```
{
```

```
    if(s->top==s->size-1)
```

```
    {
```

```
        printf("The stack is full\n");
```

```
        return 1;
```

```
    }
```

```
    else
```

```
    {
```

```
        printf("The stack is not full\n");
```

```
        return 0;
```

```
    }
```

```
}
```

```
int push(struct Stack *s)
```

```
{
```

```
    int item1;
```

```
    int g=isFull(s);
```

```
    if(g==0)
```

```
{
```

```
    printf("Enter the value that is to be pushed=");
```

```
    scanf("%d",&item1);
```

```
    s->top=s->top+1;
```

```
    s->array[s->top]=item1;
```

```
    printf("Pushed the element to stack\n");
```

```
    return 0;
```

```
}
```

```
return 0;
```

```
}
```

```
int pop(struct Stack *s)
```

```
{
```

```
    int p=isEmpty(s);
```

```
    if(p==0)
```

```
{
```

```
    s->top=s->top-1;
```

```
    printf("The element was popped\n");
```

```
    return 0;
```

```
}
```

```
return 0;
```

```
}
```

```
void print_top(struct Stack *s)
```

```
{  
    printf("The topmost element is %d\n",s->array[s->top]);  
}
```

```
int main()
```

```
{  
    int size;  
    printf("Enter the size value = ");  
    scanf("%d",&size);  
    struct Stack *s=createStack(size);  
    printf("Enter a value for the following operation:\n");  
    int x;  
    while(1)  
    {  
        printf("1.For push operation \n2.For pop operation \n3.For the value of top \n4.To  
check if empty \n5.To check if full \n6.To exit\n");  
        scanf("%d",&x);  
        switch(x)  
        {  
            case 1:  
                push(s);  
                break;  
            case 2:  
                pop(s);  
                break;  
            case 3:  
                print_top(s);
```

```

        break;
    case 4:
        isEmpty(s);
        break;
    case 5:
        isFull(s);
        break;
    case 6:
        exit(0);
    }
}
}

```

Output:

```

PS C:\Users\breez\OneDrive - pdpu.ac.in\PDPU\ab\Practise-4\" ; if ($?) { gcc Problem1.c
Enter the size value = 2
Enter a value for the following operation:
1.For push operation
2.For pop operation
3.For the value of top
4.To check if empty
5.To check if full
6.To exit
1
The stack is not full
Enter the value that is to be pushed=5
Pushed the element to stack
1.For push operation
2.For pop operation
3.For the value of top
4.To check if empty
5.To check if full
6.To exit
3
The topmost element is 5
1.For push operation
2.For pop operation
3.For the value of top
4.To check if empty

```

```
3
The topmost element is 5
1.For push operation
2.For pop operation
3.For the value of top
4.To check if empty
5.To check if full
6.To exit
